

Technical Lead / Architect

Mawhub • Egypt • Full-time • Engineering

About the Role

Mawhub is building the next generation of AI-powered recruitment technology. We are looking for a Technical Lead / Architect to own the end-to-end design and delivery of our platform — from scalable backend APIs to real-time AI agent pipelines that assist recruiters during live interviews.

This is a high-impact, hands-on leadership role. You will set the technical direction, mentor engineers, and ship production-grade systems that directly shape how recruitment works.

Responsibilities

- Own backend architecture and system design decisions for the recruitment platform
- Lead and mentor a cross-functional engineering team across backend, AI, and integrations
- Design and integrate AI agent pipelines for real-time interview assistance
- Define and enforce API contracts, data models, and service boundaries
- Collaborate with product and recruiter stakeholders to translate requirements into technical solutions
- Drive ERPNext / Frappe module development for ATS and recruitment workflows
- Ensure system reliability, scalability, and security across all services
- Establish engineering best practices, code review standards, and delivery processes

Requirements

- 8+ years of backend software engineering experience
- Proven experience as a Technical Lead or Architect on SaaS platforms
- Strong system design skills — distributed systems, APIs, event-driven architecture
- Hands-on experience with LLM integration and AI agent orchestration
- Proficiency in Python and/or Golang with FastAPI or similar frameworks
- PostgreSQL expertise — schema design, performance tuning, and complex queries
- Familiarity with real-time systems: WebSockets, streaming, Voice Activity Detection
- Experience with Docker, Kubernetes, and CI/CD pipelines

Nice to Have

- Experience building ATS or recruitment technology platforms
- ERPNext / Frappe development and custom module design
- Knowledge of pgvector, semantic search, or embeddings
- Exposure to multi-agent system design or AI pipeline orchestration

- Previous product ownership or technical leadership in a startup environment

Interview Evaluation Areas

Candidates will be assessed across the following skill areas during the technical interview round:

- System Design — scalable distributed systems and real-time architecture
- AI Agents — agent pipeline design, contracts, and fallback handling
- Recruitment Systems — ATS data modeling, ERPNext, and workflow design
- Software Engineering — code structure, testability, and API design
- Technical Strategy — architectural decisions, governance, and enterprise concerns
- Team Management — engineering leadership, conflict resolution, and delivery
